

Sigma Notation: Simplification Rules

Video companion

1 Distributive property

Examples:

$$\begin{aligned}\sum_{i=1}^4 i^2 &= 30 \\ \sum_{i=1}^4 3i^2 &= 3(1)^2 + 3(2)^2 + 3(3)^2 + 3(4)^2 \\ &= 3[1^2 + 2^2 + 3^2 + 4^2] \\ &= 3 \left[\sum_{i=1}^4 i^2 \right]\end{aligned}$$

$$\sum_{r=4}^{25} 18r^3 = 18 \left[\sum_{r=4}^{25} r^3 \right]$$

This is due to the *distributive property*:

$$a(b + c) = ab + ac$$

In other words, constants inside the summed expression can be pulled outside.

2 Commutative property

$$\begin{aligned}\sum_{i=1}^4 (i^2 + 2i) &= (1^2 + 2(1)) + (2^2 + 2(2)) + (3^2 + 2(3)) + (4^2 + 2(4)) \\ &= (1^2 + 2^2 + 3^2 + 4^2) + (2(1) + 2(2) + 2(3) + 2(4)) \\ &= \left(\sum_{i=1}^4 i^2 \right) + \left(\sum_{i=1}^4 2i \right)\end{aligned}$$

This is due to the *commutative property*:

$$a + b = b + a$$

In other words, we can add the terms in any order.

3 Summation of constants

Examples:

$$\begin{aligned}\sum_{k=1}^{10} 5 &= 5 + 5 + 5 + 5 + 5 + 5 + 5 + 5 + 5 + 5 \\ &= 10 \cdot 5 \\ &= 50\end{aligned}$$

$$\begin{aligned}\sum_{r=1}^7 8 &= 8 + 8 + 8 + 8 + 8 + 8 + 8 \\ &= 7 \cdot 8 \\ &= 56\end{aligned}$$

When summing constants, you can multiply the constant by the number of indices you count.
